Daedalus Innovations LLC is a biotechnology company that is leading the way in the use of encapsulation of macromolecules in reverse micelles for structural studies. Employing NMR spectroscopic techniques, the reverse micelle method makes possible the study of the more problematic systems in biotechnology today, such as integral membrane proteins and intrinsically unfolded or aggregating proteins. Daedalus is the sole licensor of the core reverse micelle and high pressure NMR cell patents.

The company currently exports to Canada, France, Germany, Great Britain, and Switzerland and is always looking to expand their business.

According to Ronald Peterson, chief scientific officer,
 “Our continued survival is dependent on international trade. If the current level of requests for product quotes is any indication, our international trade will account for well over 50% of this year’s sales. Any expansion of the business, including additional employees, would be less likely without our growing international trade.”
